RESTAURANT MANAGEMENT SYSTEM

Introduction

In this project, our goal is to create a database for "Paşazade" restaurant. With this database we will create, we will facilitate our customer's business follow-up. After completing our database design, we will create a user-friendly web interface so that our client can manage it.

What Will Be In Our Database?

Our database will have all the data that could be important, and we will try to reach the best design by connecting these data with rational solutions. For example, we will keep all necessary information about customers. Likewise, we will keep employee information by categorizing them according to their positions. We will keep the menu information by categorizing the foods in it. We will also have entity for the recipe of the foods. We will keep payment information, either by credit card or cash. The bill information will also be in a separate entity. We will link order, booking and table informations. The database will also keep the information of the food ingredients in order to see the stock information.

Customer Information

Ben "Paşazade Chef" isimli restaurantın işletmecisiyim.
Öğrencilere veri tabanımı kullanıp, geliştirmeleri için gerekli yardımı
söğleyeceğim.

Tel: 0212-435-69-69

Adres: Kocasinan Merkez Mah.

Mahmutbey Caddesi No: 202-A
